KATflow 180 G

Gas Clamp-On Ultrasonic Flowmeter

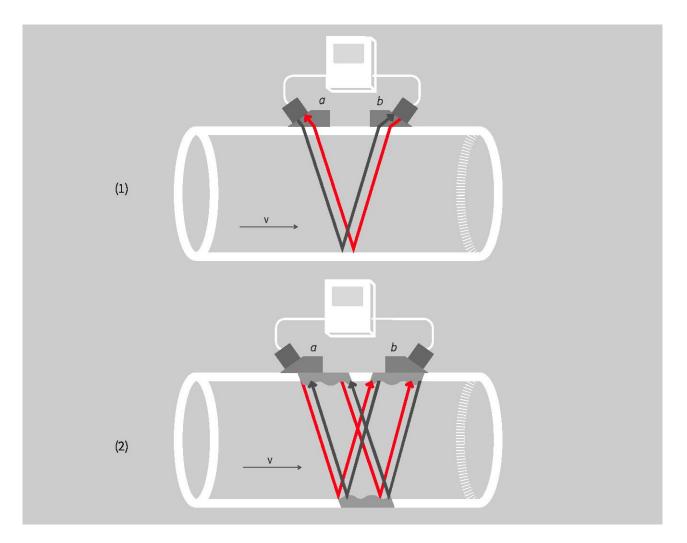

MEASUREMENT FROM AMMONIA TO XENON

Our Katronic[™] range flowmeters are well established for liquid flow applications and can now be applied for the non-invasive measurement of gases. The new method not only provides measurements at high pressure gas flows but also down to atmospheric conditions even in steel pipes which was impossible until recently. This unique innovation is achieved through advances in sensor tech-nology, powerful sophisticated electronics, adaptive filtering techniques and innovative signal processing algorithms using Digital Signal Processors (DSPU's).

THE TECHNOLOGY BEHIND THE MEASUREMENT

The non-invasive measurement of gas flow is more difficult than for liquids owing to the high damping characteristics of the gaseous media. These properties mean that traditional transit-time techniques using Shear Wave sensors can only be applied for higher pressuregas pipelines. In order to successfully measure low pressure applications alternative Lamb Wave transducers should be considered instead. This method involves ultrasonic signals being excited into the pipe at the reson-ance frequency of the pipe wall and material which causes the pipe to become both the transmitting and sensing device. By operating in this way higher receiving signal amplitudes can be achieved thereby compensating for the signal attenuation of the gas. The active transmission area of the pipe wall created is several times the length of the actual transducer, resulting in broader signal characteristics which allow measurements over a wider range of operating conditions. This is important as temperature, pressure and gas composition can change and the flowmeter needs to be able to adapt to these variations.

Sensors a and b work alternately to send and receive ultrasonic pulses. The sound waves ab travelling with the flow move faster than those travelling against it ba. Sensor mounting arrangements for Shear Wave (1) and Lamb Wave (2) signal evaluation shown.

Specification

- Pipe diameter range 25 mm to 1500 mm
- Temperature range for safe area sensors
 -20 °C to +135 °C (-4 °F to 275 °F), for Ex-sensors
 -40 °C to +80 °C (-40 °F to +176 °F)
- Robust IP 66 unit with OLED display and glass-fronted keypad
- Pressure range 1 bar (absolute) to unlimited maximum
- Flow velocities 0.1 m/s to 75 m/s
- All commonly used pipe materials

Features

- Suitable for installation in safe and/or hazardous areas
- Shear and Lamb Wave IP 68 stainless steel sensors
- Process output options including current, open-collector, relay
- Communication option Modbus RTU, Modbus TCP/IP
- Inputs for temperature, pressure and gas compressibility factor available
- Web-based data evaluation, instrument setup via wired, wireless or GSM connection

Applications

- Measurement on natural gas pipelines
- Natural gas storage installations
- Control of compressor stations
- Sour gas measurements
- Synthesised gas flow measurements
- Compressed air flow measurements

Media

Air, argon, carbon monoxide, ethane, ethylene, helium, hydrogen, natural gas, nitrogen, nitrous oxide, oxygen, process gas, propane, saturated steam, sour gas

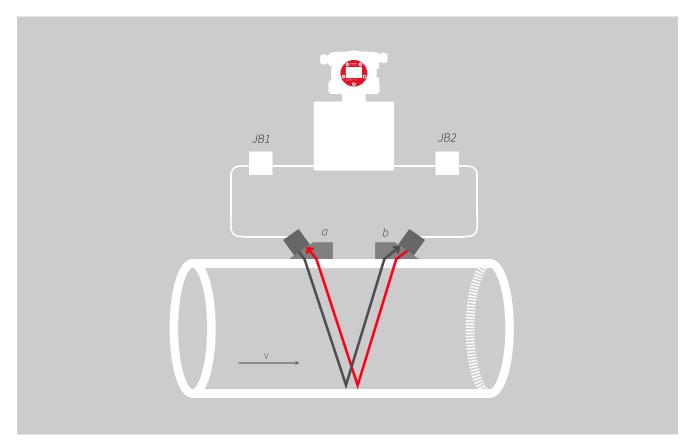

FLOWMETERING SYSTEM

Performance

Measurement principle	Ultrasonic correlation transit-time difference
Flow velocity range	0.1 75 m/s
Resolution	0.25 mm/s
Repeatability	0.15 % of measured value, ±0.015 m/s
Accuracy	Volume flow: ±1 3 % of measured value depending on application
Turn down ratio	1/200 (equivalent to 0.35 75 m/s)
Measurement rate	100 Hz (standard)
Response time	1 s (standard), 90 ms (optional)
Damping of displayed value	0 99 s (selectable by user)
Pressure range	0.1 MPa (1 bar) to unlimited maximum
Liquid content of gas media	< 5 % of volume
